Permanent Hair Removal

Forget about Waxing and Shaving FOREVER! During the treatment laser light is attracted to the pigment (melanin) in your hair. This heats the hair follicle to a degree that it results in permanent damage to the hair follicle.

The 'gold standard' for laser hair removal is a Long Pulsed Alexandrite laser. For darker skin types, the Nd: YAG is the laser of choice. These lasers are higher powered medical lasers.

The difference between these medical lasers and Intense Pulsed Light (IPL) for the treatment of unwanted hairs is that this is not the gold standard. (IPL is better suited to treatment of pigmentation and evening out skintone.)

What is different about laser treatments at Slievemore Clinic?

Here at Slievemore Clinic all laser treatments are provided by a medical doctor rather than a therapist. The practitioner has obtained the BTEC Laser qualification for treatment of unwanted hair, veins, pigmentation and facial rejuvenation.

What happens during your treatment?

Laser light is attracted to pigment melanin present in hair. The targeted hair follicle is heated to a degree that results in permanent damage to hair follicle.

What areas can be treated?

Laser can treat any hair bearing areas such as legs, face, underarms, bikini etc. eyebrows can not be treated

How many treatments are recommended

Usually between six to eight treatment sessions are required. Results may be seen sooner but a full session is recommended for long lasting results.

What should I expect after each treatment?

Your skin may experience slight heat and redness. This is perfectly normal. Also there may be slight swelling bumps around hair follicle. Rarer side-effects include hyperpigmentation or hypopigmentation. Delayed shedding is also possible where your hair can take 2 weeks to fall out and during that time can appear to look as if it is growing. This is temporary and the hair will fall out after approximately 2 weeks.

Prior to your treatment

- Avoid sun exposure for 6 weeks before your treatment. This is vital otherwise you run the risk of burning with laser treatments as the melanin in your skin is overstimulated.
- Avoid applying fake tan for 2 week prior to your treatment. This includes tinted moisturisers such as Nivea and Johnsons, L'Oreal Sun Shimmer etc.
- Do not pluck, wax or thread the area to be treated 2 weeks prior to your treatments. The principle behind hair removal is that you need to have hair present in the hair follicle to work.
- Shaving area either the night before or the morning of your treatment is recommended in order to maximise effects from your treatment.
